Retail & Commerce: evidence-backed page maintenance

Release evidence updated · 18 October 2026

AI-generated image · synthetic product

Fix the page.
Not just the ticket.

Customer feedback becomes a precise page repair, with visible evidence and a way back.

Brief about the idea

A merchant receives the same product question again.

Pagemi connects that question to the page, the product image and merchant-confirmed facts.

It proposes the smallest supported change, requests missing facts, and verifies the published version.

Opportunities

A support reply can leave the confusing page unchanged.

Pagemi links repairable feedback to verified wording, pauses for missing facts, expires outdated approvals, and checks the served page.

Merchant interviews and measured time savings remain future validation.

Features in the working prototype

One product. Three editable fields.

Source-linked classification and minimal field differences
Merchant-confirmed supplements and reassessment
Approval bound to evidence, content and page versions
Transactional publication, served-page checks and rollback

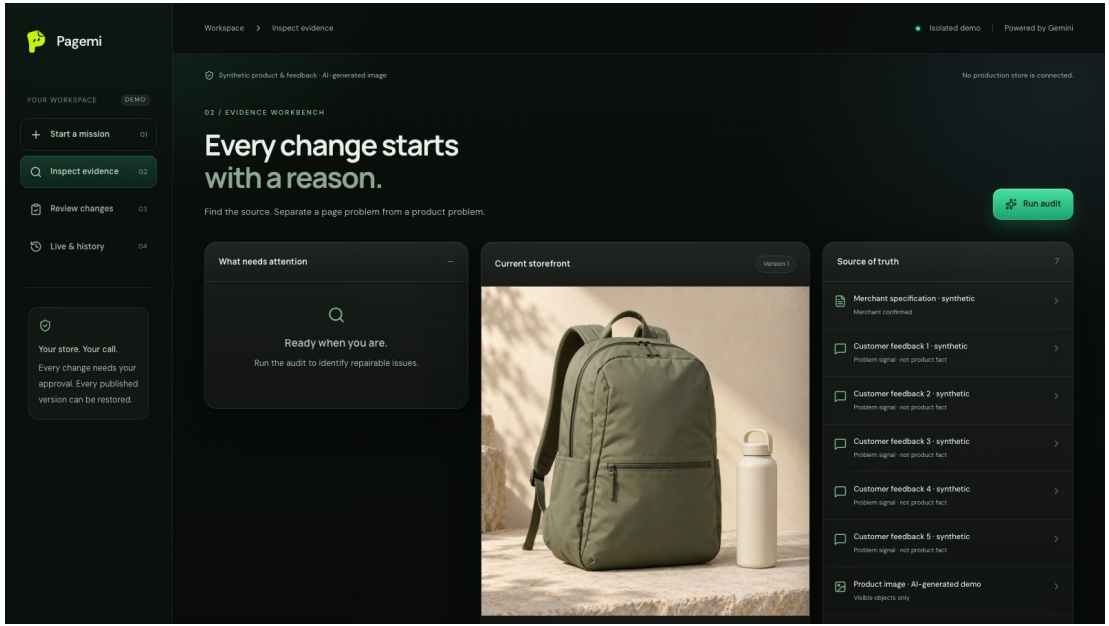

Price, inventory, policy and certification edits are blocked.

Repair workflow

01	**Evidence**	Feedback + specification + image
02	**Judgment**	Repair / request facts / conflict / human action
03	**Review**	Minimal patch + a separate semantic check
04	**Approval**	Merchant accepts exact text and source revision
05	**Execution**	Publish → read served page → verify or restore

Evidence workbench

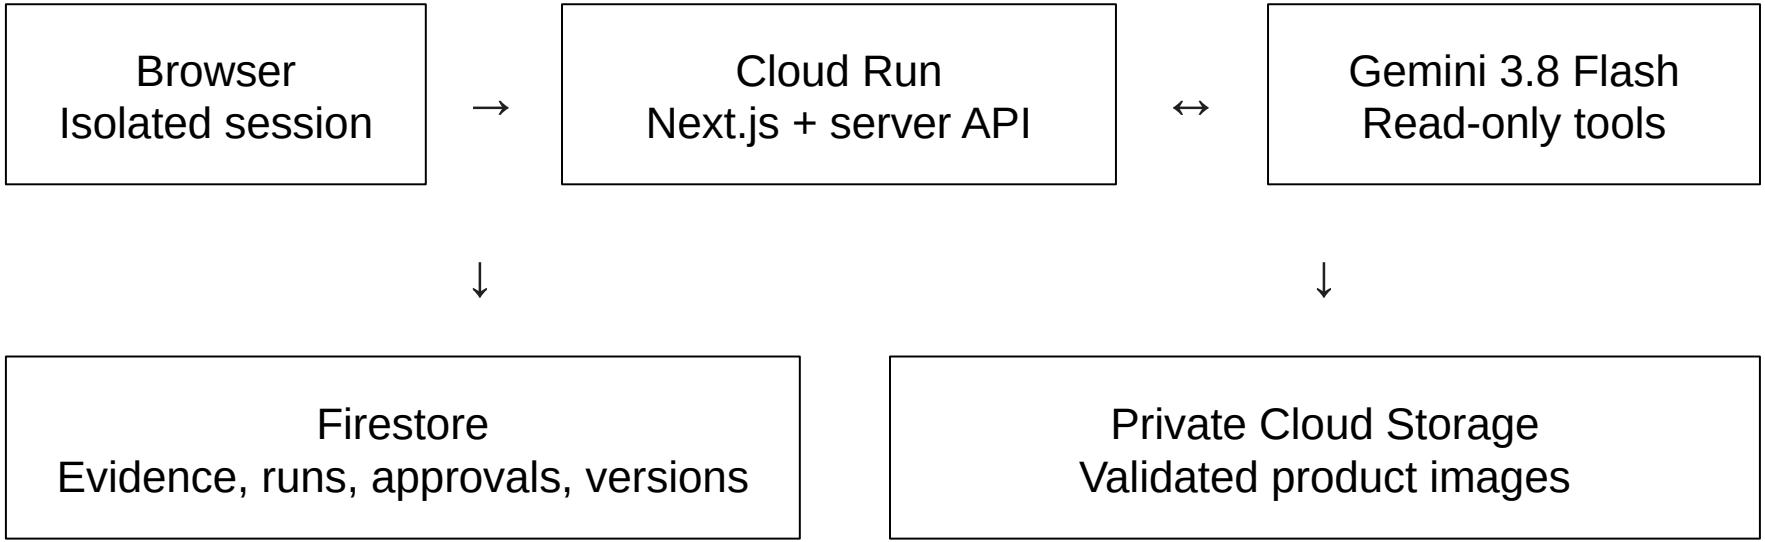

Live interface, 18 October 2026.

Feedback identifies the problem. Merchant facts support the repair.

This screenshot shows the input state before the audit.

Google Cloud architecture

Cloud Run handles writes and verification. The model has no publish tool.

Technologies used

Gemini 3.8 Flash through official Vertex AI
Text, image, read-only tools and structured output

Next.js + TypeScript on Cloud Run
Firestore transactions + private Cloud Storage

Independent verification request, schema and permission gates, scoped sessions and exact-origin writes

Bounded prototype operation

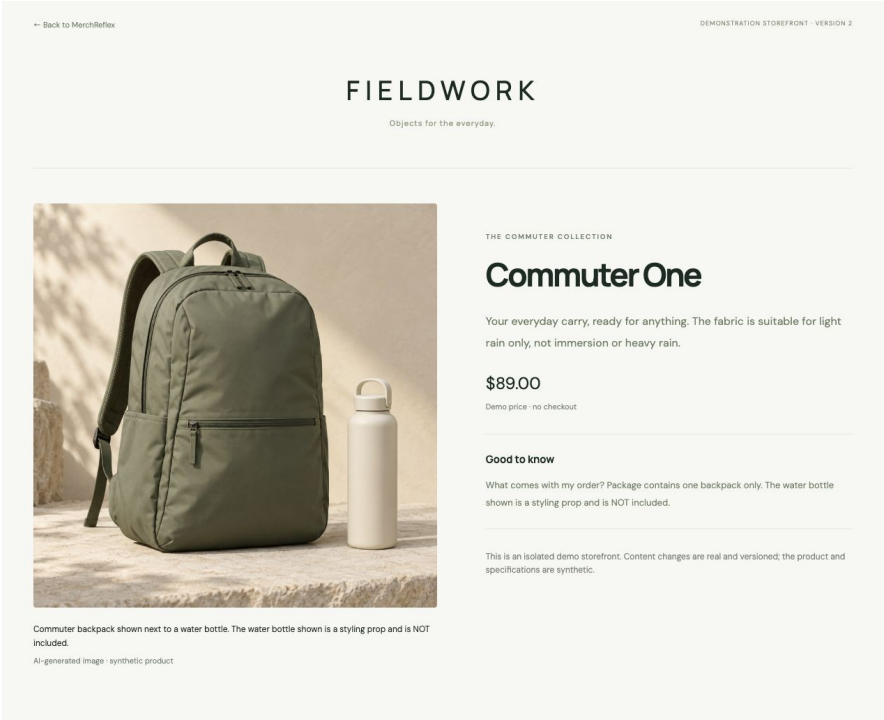

18 October release verification
Conservative new workflow accounting: about USD 0.70

Shared per-request reservations, input/output limits,
daily capacity and maximum two Cloud Run instances.

Hosting, builds and storage are billed separately.
This estimate is not total development cost or an invoice.

Published prototype

Historical storefront capture, 13 October 2026.

Bottle exclusion and supported rain wording appeared on the served page.

The current release passed publish, verify and restore in five public workflows.

Performance and evaluation

5 consecutive public workflows passed on the release.
Full journey: 20.2–69.5 seconds across these five runs.
35 local tests passed; build and type-check passed.

Two earlier public attempts failed on provider timeouts.
Human accuracy grading and merchant testing: pending.

Synthetic tests. No revenue, return-rate or accuracy claim.

Future development

Next validation
Human-grade the frozen holdout, compare content with the baseline, and observe two non-developer task tests.

After qualification
Use authorized merchant records, connect one development store, then test repeat usage and time saved.

Measure adoption before setting a price or claiming ROI.

Public prototype and source

GitHub
https://github.com/joeymilano/pagemi

Live product
https://pagemi.joeyzhao.cc

English video: production handoff ready; public link pending.
Current portal requests 3–4 minutes; master target 3:15.

Evidence and limitations

Synthetic product facts and an AI-generated image.
Merchant confirmation is not third-party certification.

Published content can be read, checked and restored.
Customer understanding and business impact are unmeasured.

Same-model checking can repeat mistakes.
Human approval remains required.
